## Reporting Platform Healthcheck

*Evaluate & improve reporting environment and processes*

### **Delivering Value**

Mariner's Reporting Platform Healthcheck evaluates your reporting environment and processes to uncover ways to better support reporting and decision-making. Our healthchecks are designed to minimize report lag, maximize the investment in Microsoft SQL Server, increase efficiency, and build trust in your reports. In addition, we identify gaps between your current reporting practices and industry best practices to ensure your reporting platform is helping you achieve your business goals – ensuring that information is an asset for your organization.

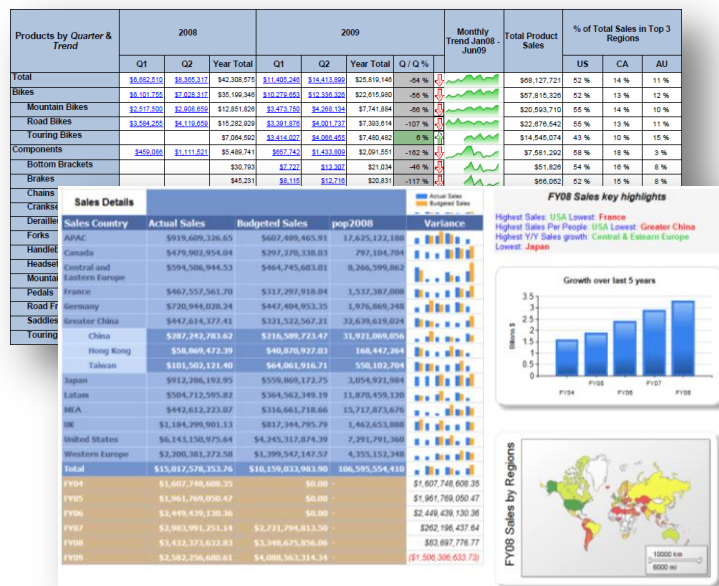

### **Providing Measurable Benefits**

Reports are a mission-critical business tool for today's successful enterprises. Making actionable decisions based on "certified data" with a "single version-of-the-truth" differentiates leaders from the rest of the competition. However, this requires that IT continually assess the ability of its systems to meet the changing and complicated reporting demands of business users. Mariner's reporting healthcheck provides a "trusted advisor" assessment to help you to understand what is required to design a more compliant and trusted reporting platform. By improving the reporting platform, the IT department becomes the catalyst for helping everyone in the company make timely decisions with more confidence and reliability.

Core  
Group

## Our Healthcheck includes:

- Reviewing reporting environment & architecture
- Understanding reporting objectives and current reporting burden
- Reviewing architectural components
  - SQL Server production database (source data)
  - ETL or data replication process
